USER MANUAL

# Brivio

A single mobile app for running a construction site — attendance, daily progress, materials, expenses, invoicing, payments, and team chat, each scoped to exactly what your role needs. This manual covers every screen, every role, and every rule the app enforces.

01 — BEFORE YOU BEGIN

# Getting Started

Everything you need to get from "never opened the app" to "signed in and on my dashboard."

1

### Create an account

On the welcome screen, tap **Sign up**. Enter your full name, email, a password (6+ characters), and pick your role from the dropdown — Builder, PM, Site Engineer, Supervisor, Vendor, or Contractor. Choose carefully: only a Builder or PM can grant you a different role later by editing your project assignment, and no one can change their own role from the app.

2

### Log in

Enter your email and password and tap **Log In**. The app reads your role from your profile and takes you straight to the matching dashboard — there's no separate "choose your role" step at login.

3

### Forgot your password?

Tap **Forgot password?** under the password field on the login screen, enter your account email, and tap **Send Reset Link**. A reset email arrives from Firebase within a minute or two — follow the link to set a new password, then log in as usual.

4

### Show/hide password

Every password field — login, sign up, and change password — has an eye icon on the right. Tap it to check what you typed before submitting.

5

### Choose your language

Open **Profile & Settings** (tap your avatar on any dashboard) and use the **Language** dropdown to switch between English, हिन्दी, தமிழ், and తెలుగు. It applies immediately and is saved to your account, so it follows you if you log in on a different phone.

6

### Dark mode

Also on **Profile & Settings** — flip the **Dark Mode** switch. It's a device-level preference and applies instantly across the whole app.

**One account, one role.** A role is fixed at sign-up and isn't a per-project setting — if you need to act as two different roles (say, PM on one project and Site Engineer on another), you'll need two separate accounts with two different emails.

02 — WHO'S WHO

# Roles & Responsibilities

Brivio has six roles, each with its own dashboard, its own bottom navigation, and its own set of allowed actions — both in what you see on screen and in what the app's database will actually accept from your account.

## Builder / Owner

Sees everything

Views every project in the organization. Doesn't do day-to-day data entry — approves and oversees.

- Approve or reject expenses logged by the PM
- View attendance, progress, and payment summaries across all projects
- Manage material inventory (add / adjust / delete stock)
- View safety checklists and Photo Timeline

BOTTOM NAVIGATION

Home | Projects | Expenses | More

## Project Manager

Runs day-to-day operations

Sees every project. The busiest role — most workflows pass through the PM at some point.

- Create projects and assign the team to them
- Approve material requests and pick the fulfilling Vendor
- Log expenses and assign tasks to Supervisors
- Pay Vendor purchase orders and Contractor invoices
- Export a project's PDF report

BOTTOM NAVIGATION

Home | Projects | Tasks | More

## Site Engineer

On-site coordination

Sees only the projects they're assigned to.

- Mark laborer attendance and self check-in
- Raise material requests
- Log daily progress with photos
- Assign tasks to Supervisors
- Conduct safety checklists

**BOTTOM NAVIGATION**

Home | Attendance | Progress | More

## Supervisor

Executes assigned work

Sees only the projects they're assigned to.

- Mark laborer attendance and self check-in
- Work through tasks assigned by PM/Site Engineer
- Log daily progress with photos
- Conduct safety checklists

**BOTTOM NAVIGATION**

Home | Attendance | My Tasks | More

## Vendor / Supplier

Not project-assigned

Not tied to specific projects — instead sees every purchase order addressed to them, across any project.

- View purchase orders assigned to you
- Update status: Dispatched, then Delivered
- Submit an invoice once delivered (photo + amount)
- Track when the PM has paid you

**BOTTOM NAVIGATION**

Home | Purchase Orders | Team Chat

## Contractor / Subcontractor

Owns a scope of work

Sees only the projects they're assigned to, with a specific scope of work set by the PM.

- See your assigned scope of work on each project
- Self check-in
- Log daily progress for your scope
- Submit invoices for completed work, any time

**BOTTOM NAVIGATION**

Home | Progress | Invoices | Team Chat

**Getting assigned to a project.** Site Engineers, Supervisors, Contractors, and Vendors don't add themselves to a project — a Builder or PM adds you from that project's detail screen (`Projects → tap a`

`project → person-add icon`). If a project you expect to see isn't showing up anywhere in the app, ask your PM to check your assignment.

03 — CORE WORKFLOWS

# Attendance

Two separate, independent attendance systems — one for laborers who don't have app accounts, one for staff who do.

### Labor headcount

**Marked by Site Engineer or Supervisor · viewed by Builder/PM in Attendance Overview**

Open `Attendance` on your dashboard, pick a project, and add each laborer by name once (they don't need an account). Each day, tap the green check or red cross next to a name to mark them Present or Absent — one tap updates it instantly for anyone else looking at that project.

### Staff self check-in

**Used by Site Engineer, Supervisor, and Contractor**

On your dashboard's Home tab, pick your project and tap **Check In Today**. It records the exact time and switches to "Checked in at HH:MM" for the rest of the day — there's nothing to undo, and it resets automatically the next day.

The PM does not check in and does not appear in Labor Headcount — the PM's Attendance Overview is a read-only summary of both systems across every project.

# Daily Progress Log

A dated diary entry per project, with a photo and a live weather reading, that everyone downstream can see.

**Logged by Site Engineer, Supervisor, or Contractor · reviewed by Builder/PM in Progress Log Overview and Photo Timeline**

Pick a project, describe today's work, drag the % Complete slider, and optionally attach a photo from your camera or gallery. If the project has a location set, a weather card appears automatically above the form — temperature, condition, humidity, and rainfall for right now, useful context if weather affected the day's work. Submit, and it's added to your history below, with every earlier entry's photo tappable to view full-screen.

No location set on the project? The weather card is quietly replaced with a note instead of an error — logging still works fine without it. A Builder or PM can add a location from the project's detail screen (location-pin icon).

## Material Procurement

The longest pipeline in the app — a material request travels through five roles before it's fully closed out.

## Request to payment

6 steps

Every step below is visible in real time to whoever raised or is waiting on it — no one needs to refresh or ask "what's the status?" in chat.

1 **SITE ENGINEER**

### Raise a material request

Open `Material Requests`, pick the project, and tap the + button — item name, quantity, unit, and an optional note.

2 **PM**

### Approve and assign a Vendor, or reject

Pending requests show a green check and a red cross. Approving opens a list of Vendor accounts to pick from — choosing one automatically creates a Purchase Order and notifies the Site Engineer who raised it. Rejecting just notifies them, with no PO created.

3 **VENDOR**

### Mark Dispatched, then Delivered

The assigned Vendor sees the order under Purchase Orders and advances its status with a single tap each time — Pending → Dispatched → Delivered.

4 **VENDOR**

### Submit an invoice

Once Delivered, a **Submit Invoice** button appears — attach a photo of the invoice and enter the amount. This is the only price ever recorded for this order.

5 **PM**

### Pay Now

As soon as an invoice exists, a **Pay Now** button appears on the PM's Purchase Orders list. Tapping it opens a secure Razorpay checkout for the invoiced amount (test mode — see the payments note below).

6 **VENDOR + PM**

### Paid

On a successful payment, the order's status flips to **Paid** on both the Vendor's and the PM's screens, with a payment reference recorded. If the checkout is cancelled or fails, nothing changes — the order stays exactly as it was and can be paid again later.

## Expenses

A lighter, two-step approval loop for project spending outside of vendor purchase orders.

**PM logs · Builder approves or rejects**

The PM opens `Expenses`, picks a project, and adds an amount, category (Materials, Labor, Transport, Equipment, Other), an optional note, and a date. It starts as **Pending** and notifies every Builder. A Builder reviews it from their own Expenses screen and taps approve or reject — only **Approved** expenses count toward the project's spend in Project Summary and the PDF report. You can filter the expense list by category from the dropdown at the top.

## Contractor Invoicing & Payment

A separate, simpler payment lane from the Vendor one above — no approval gate, just submit and get paid.

**Contractor submits · PM pays**

From `Invoices`, a Contractor can submit as many invoices as they want, any time — no need to wait for a delivery status like the Vendor flow. Each one needs an amount, an optional note, and a photo of the invoice. Every submitted invoice immediately shows a **Pay Now** button on the PM's Contractor Invoices screen; paying it works exactly like the Vendor flow (Razorpay test-mode checkout, status flips to Paid on success only).

> Unlike material requests, there's no reject option here — a submitted invoice is either unpaid or Paid.

## Tasks

A simple three-state assignment loop between the office and the Supervisor doing the work.

### Assign to completion

3 steps

1. **PM / SITE ENGINEER**

   **Assign a task**

   Pick a project, then a Supervisor already on that project's team, give the task a title, description, and optional due date.

2. **SUPERVISOR**

   **Start it**

   From `My Tasks`, tap **Start** to move it from Assigned to In Progress.

3. **SUPERVISOR**

   **Complete it**

   Tap **Complete** when finished. Overdue tasks (past their due date and not yet Completed) show their due date in red on both the assigner's and the Supervisor's screens.

## Other Features

Everything else in the app, in one place.

### Safety Checklists

**Conducted by Site Engineer / Supervisor · viewed by Builder / PM / Site Engineer / Supervisor**

A fixed checklist of site-safety items, ticked off per visit with an optional note, timestamped and attributed to whoever conducted it. Tap any past checklist to expand it and see exactly which items passed or failed.

### Material Inventory

**Edited by Builder / PM · read-only for Site Engineer / Supervisor**

A running stock list per project — name, quantity, unit. Builder/PM can add items and nudge quantities up or down with +/− buttons; everyone with access can search the list by name.

### Team Chat

**Everyone assigned to the project, plus Builder/PM**

One shared thread per project for quick coordination. Membership isn't configured separately — it's exactly whoever is already assigned to that project elsewhere in the app.

### Notifications

**Everyone, automatically**

The bell icon on every dashboard badges you when something needs your attention: a task assigned to you, your material request approved or rejected, a purchase order dispatched, a new/decided expense, or a safety checklist submitted. Tap a notification to jump straight to the relevant screen.

### Project Summary

**Builder / PM**

Per-project stat cards: labor attendance %, average progress with a trend chart, total approved expenses with a by-category pie chart, and total paid Vendor + Contractor payments. Reachable from the dashboard's Home tab or the More menu.

### PDF Report Export

**PM**

Generates a one-page PDF — budget vs. approved/pending spend, remaining budget, average progress, and a full table of approved expenses — then opens your device's native share/print sheet. No file permissions needed; nothing is saved unless you choose to.

### Photo Timeline

**Builder / PM**

Every progress-log photo for a project, in one chronological scroll — tap any photo to view it full-screen with pinch-to-zoom.

### Profile & Settings

**Everyone**

Edit your name and photo, change your password (asks for your current one first), toggle Dark Mode, and switch Language — all from one screen, reached by tapping your avatar on any dashboard.

## Full-screen photos

**Everywhere a photo appears**

Any small photo in the app — invoice photos, progress photos, your own profile photo — opens full-screen with pinch-to-zoom when tapped. Tap back or the top bar to close.

04 — REFERENCE

# Rules & Guidelines

The constraints the app enforces everywhere, not just what a screen happens to show you.

### Permissions are enforced twice

Every restriction you see in the interface — a hidden button, a missing screen — is backed by the same rule on the database itself. Even if a screen didn't hide an action from you, the underlying save would still be refused if your role doesn't permit it.

### Project visibility is role-based

Builder and PM see every project automatically. Site Engineer, Supervisor, and Contractor only see projects a Builder or PM has explicitly assigned them to. Vendor isn't tied to projects at all — they see purchase orders addressed to them, from any project.

### A role can't be self-changed

Your role is set once at sign-up. Nothing in the app lets you change your own role later — only your name, photo, and password are self-editable.

### Payments are test mode only

Every "Pay Now" button opens Razorpay in **test mode** — no real money ever moves, regardless of what card or UPI details are entered. Use Razorpay's published test values: card `4111 1111 1111 1111`, any future expiry, any CVV, for a successful payment; card `4000 0000 0000 0002` to see the failure path.

### Cancelled or failed payments change nothing

If you back out of a Razorpay checkout or it fails, the purchase order or invoice is left exactly as it was — never partially marked, never stuck. You can always try Pay Now again.

### One organization at a time

Brivio is built for a single construction firm's projects, not multiple isolated companies sharing one install. Every Builder/PM account sees every project in the same organization.

# Permission Matrix

A quick reference for who can do what. A full dot means the role can perform this action directly; a half dot means it's limited to their own submissions or a read-only view.

| ACTION | BUILDER | PM | SITE ENG. | SUPERVISOR | VENDOR | CONTRACT |
|---|---|---|---|---|---|---|
| View all projects | ● | ● | ○ | ○ | ○ | ○ |

Half dot on Attendance = Contractor only self check-in, not labor headcount. Half dot on Inventory = Site Engineer/Supervisor can view and search, not add or edit.

## Status Glossary

The colored pill on a list item always means the same thing everywhere it appears.

| | |
|---|---|
| **Pending** | Waiting on someone else's decision — a request, expense, or invoice not yet acted on. |
| **Approved** | Signed off — an expense or material request that was accepted. |
| **Rejected** | Declined — no purchase order or payment will follow. |
| **Dispatched** | Vendor has sent the materials but they haven't been confirmed delivered yet. |
| **Delivered** | Materials have arrived — the Vendor can now submit an invoice. |
| **Submitted** | A Contractor invoice awaiting payment — no approval step, just waiting on Pay Now. |
| **Paid** | Payment completed through Razorpay — end of the line for that order or invoice. |
| **Assigned** | A task has been given out but work hasn't started. |
| **In Progress** | A Supervisor has started work on a task. |
| **Completed** | A task is finished. |
| **Present** | Laborer marked present for the day. |
| **Absent** | Laborer marked absent for the day. |

## FAQ & Troubleshooting

Common questions, answered directly.

**I logged in but don't see any projects.**

Unless you're a Builder or PM, projects don't appear automatically — a Builder or PM has to assign you from that project's detail screen first. Ask them to check `Projects → your project → person-add icon` and confirm you're checked.

**The weather card isn't showing on Progress Log.**

The project has no location set yet, or the location couldn't be found. A Builder or PM can add one from the project's detail screen (tap the location-pin icon in the top bar) — it only needs to be set once per project.

**Why don't I see a "Pay Now" button?**

For a Vendor purchase order, an invoice has to be submitted first (which itself needs the order to reach Delivered). For a Contractor invoice, it should appear as soon as it's submitted. If you're not a PM, you won't see it at all — paying is a PM-only action.

**I can't approve or reject something I think I should be able to.**

Check the Permission Matrix — approvals are split by type: the PM approves material requests, and the Builder approves expenses. If your role doesn't match, the button genuinely won't appear for you, by design.

**Is my card or UPI ID actually charged?**

No. Every payment in Brivio runs through Razorpay's test mode, which cannot process a real transaction no matter what details are entered. Use the published test values in the Rules & Guidelines section to try both a successful and a failed payment safely.

**I switched the language but some screens are still in English.**

The language toggle currently covers login/sign-up, all six dashboards, and the most-used everyday screens. A handful of deeper forms and admin screens are English-only for now.

**Someone made a change but I don't see it on my screen.**

Brivio syncs in real time over an internet connection — changes should appear within a second or two without needing to refresh. If nothing updates, check your device's connection; the app needs to be online to read or write anything.

**I forgot my password and the reset email hasn't arrived.**

Check your spam/junk folder — the reset email comes from Firebase's automated sender. Make sure you entered the exact email address your account was created with; the app won't tell you whether an email is registered, as a privacy precaution.
